

# Installation guide walkway

Category	
Equipment	
	Stanley knife
	Floor cleaner free of Chlorine of Citrus.
	2 people
	Heavy weights
	Robe
Instruction	
	Clean the surface. It is important to get all materials, grease and other residue removed from the surface. The tape will stick, but will otherwise stick on the grease. You will feel and see if the floor is clean. Remove all the water and make sure the floor is 100% dry. Warning: for new concrete floors; remove the concrete veil. This is a hard to remove layer, but really important to remove. You will see and feel the difference.
	Mark the floor at the beginning and the end where the walkway should be in the length. Get your rope and place it on top of the markings with the help of some heavy weights. Make sure the rope is really tensioned between the weights. Don't be afraid the rope will break. When you lift the rope and you drop the rope it should drop back to the same point. You can use the rope as a steady reference to place the walkway in the right position.
	Unwind the role and rewind it with the blue liner facing outwards. when you have multiple roles available use these as center, otherwise the cardboard role. The extra weight of the extra role, will save time sticking the role to the floor.
	Move the role to the starting position, unwind the first meter. Make sure it perfectly lines up with your rope. Remove the first 40 cm of backliner and push it under the rest of the material. Stick the first piece of material to the floor. Make sure it is lined up perfectly, it will make the rest easier.
	Person 2 will push back the role and pull the backliner from under the role. He will keep removing the backliner as person 1 sticks the walkway to the floor.
	Person 1 can now start applying the walkway to the floor by slowly pushing it forward. As soon as the role moves away from your rope, roll it back, correct the role and stick it on again.
	Any folds in the material after applying is caused by a bend in the walkway while applying.
	When finished check if the walkway sticks on every position to the floor, otherwise roll something heavy over the walkway to make sure it sticks.
	Enjoy your result
Tips	The walkway needs 24 up to 48 hours to rest and to make the perfect sticky connection to the floor.
Tips	Don't be too afraid of removing the walkway when you stick it on the floor. Small pieces can be removed and replaced when it was not properly applied to the floor.
